1 Scope

1.1 Identification

This document is a summary of the NASA Crew Transportation System (CTS) requirements, as configured to execute missions during Exploration Spiral 1. These requirements represent a functional decomposition of the requirements expressed in the Exploration System of Systems Technical Requirements document, ESMD-RQ-0010. Ultimately, the requirements in this document can be traced back to the requirements expressed in *A Renewed Spirit of Discovery: The President's Vision for U.S. Space Exploration, January, 2004* (hereafter referred to as The Vision), and captured in the Level 0 Exploration Requirements for the National Aeronautics and Space Administration, SA-0001, May 4, 2004.

The capabilities expressed in this document will evolve and expand over time, employing the Spiral Development Process to develop human-crewed, cargo, and robotic flight and ground systems to accomplish The Vision. Emphasis has been on the Crew Exploration Development and Test requirements (Exploration Spiral 1) and the Lunar Exploration requirements (Exploration Spirals 2&3), that provide long-duration human lunar exploration capability. Requirements development for Exploration beyond Spiral 3 (e.g., human-Mars exploration) will be undertaken in the future. The controlling authority for this document is the Exploration Systems Mission Directorate (ESMD), Requirements Formulation Division, NASA Headquarters.

1.2 Document Overview

This document provides the CTS requirements that will be functionally decomposed and captured in supporting elements of the CTS. The Exploration Systems Document Tree shown in Figure 1 explains the hierarchy of requirements documents that flow down from The Vision. The relationship of this document to other Exploration Systems requirements documents is shown in Figure 2.

Note: Where a requirement is expressed with "threshold and objective" values, it has been determined that performance above the threshold (minimum performance level) is of value to NASA as a desired "objective". Where no objective value is expressed, the value shown is the threshold requirement.

Section 1 of this document contains background information with no direct requirements. Section 2 contains the applicable documents that the CTS must comply with, as specified; Section 2 also includes reference documents that are for information only, and do not contain compliance requirements. Section 3 contains requirements that begin in Section 3.1. Section 4 contains definitions of requirements verification methods. Actual verification requirements do not appear in this document, and will be treated in lower level requirements documents. Section 5 provides a glossary of Exploration terms, an acronym list, and a requirements taxonomy table.

3 Crew Transportation System (CTS) Requirements

The following text does not provide, nor represent specific requirements, but is provided as context for the requirements that follow, beginning in section 3.1.

System Description

The Vision for Space Exploration requires NASA to implement an effective and exciting program of exploration and discovery. Sustained and affordable human and robotic missions will extend the human presence across the solar system. Innovative technologies, knowledge, and infrastructures will need to be developed. Over the next two decades, NASA plans to develop a number of new capabilities and systems that are critical to enabling safe and successful human and robotic missions. Vehicle elements to be fielded within this System of Systems will use a “spiral development” approach. In spiral development, the detailed end-state requirements are not known at program initiation. Requirements are refined through system development and demonstration, risk management and continuous user feedback. This approach will build on the experience gained in early Exploration Spirals, to provide flexibility in

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 6 of 45

responding to scientific discoveries and to incorporate new technologies. Robotic Precursor Missions to the Moon and Mars will provide information necessary to conduct future human exploration (i.e., topography mapping, gravity maps, resource identification). In addition, Robotic Precursor Missions will serve as opportunities for advanced technology demonstrations.

Exploration Spiral 1/Crew Exploration Development and Test

Exploration Spiral 1 will establish the capability to test and checkout Crew Transportation System (CTS) elements in Low Earth Orbit (LEO) in preparation for future human exploration missions to the Moon. The capabilities necessary to satisfy the Spiral 1 objectives consist of a Crew Exploration Vehicle (CEV), a Crew Launch Vehicle (CLV), and ground support infrastructure. The CEV and CLV will safely transport the crew from the surface of the Earth to LEO, and return them to the Earth's surface at the completion of the mission. Demonstration of CEV and launch system performance are critical to enabling Spiral 1 objectives of safe transportation of the crew. Successive demonstrations of the CEV and launch system (including the ability to perform ascent and entry aborts) will begin with a series of risk reduction flight tests, and lead up to crewed CEV operational capability to support human exploration missions beyond LEO. The CEV must have a high degree of automated control to accomplish the early un-crewed test flights. As exploration capabilities necessary for future spirals are developed, they will be tested with the CEV in the space environment to prepare for future exploration missions. Robotic exploration missions during Spiral 1 will investigate the lunar environment and provide the needed information to prepare for safe landings and human exploration of the lunar surface. Robotic missions will also develop and mature autonomous technologies for use in the CEV.

Spiral 1 Flight Hardware Functional Descriptions:

Crew Launch Vehicle:

Will provide the propulsive force necessary to launch the CEV into LEO.

Crew Exploration Vehicle:

Will provide the necessary crew habitation functions during the ascent, on-orbit, and entry phases of the mission, including aborts. Will also provide all maneuvering capability during orbit operations and entry (including entry phase of an abort).

Robotic Precursor System:

Will provide measurements, technology demonstrations, and may provide infrastructure in advance of human missions.

Ground Support System:

Ground based facilities and capabilities will provide the ability to plan, train, process, launch, operate flight systems, as well as land, recover, refurbish or dispose of those systems.

Exploration Spiral 2/Global Lunar Access for Human Exploration

Exploration Spiral 2 will establish the capability to conduct human exploration missions to any location on the surface of the Moon without pre-positioned surface infrastructure. This Spiral 2 capability will likely be utilized to conduct human exploration of potential lunar base sites prior to the delivery of habitats and surface power systems (Destination Surface Systems). This capability could also be utilized to place humans at the lunar base camp location for habitat and surface power systems final assembly

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 7 of 45

tasks. Once the lunar base is established, this Spiral 2 capability could be utilized to explore locations which are not accessible via surface mobility assets. The systems necessary to satisfy Spiral 2 objectives consist of those developed in Exploration Spiral 1, or derivatives of those systems, plus Earth Departure Stage(s) (EDS) necessary to transport elements to the lunar vicinity as well as the Lunar Surface Access Module (LSAM) that will provide the capability for the crew to access the lunar surface. The Cargo Delivery System will deliver un-crewed elements of the Crew Transportation System into LEO and/or lunar orbit (e.g., EDS). Spiral 2 will include successive flight tests to demonstrate the flight characteristics of the CEV, EDS, and LSAM to gain knowledge of how the systems perform at greater distances from Earth and increasing levels of autonomy. Focused robotic precursor technology demonstration missions to Mars are also anticipated within this Spiral.

Spiral 2 Flight Hardware Functional Descriptions:

Crew Launch Vehicle:

Will provide the necessary propulsive force to launch the CEV and other mission elements into LEO.

Crew Exploration Vehicle:

Will provide the necessary crew habitation functions from launch to lunar orbit and return to the Earth surface, including aborts during Earth ascent. The CEV will also provide the necessary propulsive accelerations to return the mission crew from lunar orbit, independent of orbital alignment, for direct entry at Earth. The CEV will rendezvous and dock with other mission elements, such as the EDS and LSAM, in both LEO and lunar orbit. In addition, the CEV will operate un-crewed in lunar orbit while the crew is on the surface of the Moon.

Earth Departure Stage(s):

Will provide the necessary propulsive accelerations needed to transfer the various flight elements (CEV and LSAM) from LEO to lunar orbit, and provide the deceleration for lunar orbit insertion.

Lunar Surface Access Module:

Will provide the necessary crew habitation and transportation functions from lunar orbit to the lunar surface and during return to lunar orbit; will provide crew habitation during lunar surface operations. In addition, the LSAM will provide the capability for the crew to conduct science and perform routine Extra-Vehicular Activity (EVA) on the surface of the Moon.

Cargo Delivery System:

Will deliver un-crewed elements of the CTS into LEO and/or lunar orbit. CDS elements include the Cargo Launch Vehicle and the EDS.

Robotic Precursor System:

Will provide measurements, technology demonstrations, and may provide infrastructure in advance of human missions.

Ground Support System:

Ground based facilities and capabilities will provide the ability to plan, test, train, process, launch, operate flight systems, as well as land, recover, refurbish or dispose of those systems.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 8 of 45

Exploration Spiral 3/Lunar Base and Mars Testbed

Exploration Spiral 3 will establish the capability to conduct routine human long-duration missions at a lunar base to test out technologies and operational techniques for expanding the human presence to Mars and beyond. Missions in Spiral 3 will extend up to several months in duration at the lunar poles or equatorial region in order to serve as an operational analog of future Mars missions. Spiral 3 will require the development and deployment of habitats and surface power systems. These Destination Surface Systems (DSS) will be delivered to a selected location in the polar or equatorial region by the Cargo Delivery System (CDS). The number, type, and sequencing of these CDS missions have not yet been specifically defined. Once the surface systems are in place, successively longer missions will be conducted to increase the understanding of system technical performance (including health and human systems), and to provide increasing levels of operational autonomy capabilities that will be necessary for future human Mars exploration missions. The Spiral 2 capability for global access is retained in Spiral 3, and will allow exploration missions to locations not accessible from the base camp via surface mobility assets.

Spiral 3 Flight Hardware Functional Descriptions:

Crew Launch Vehicle:

Will provide the necessary propulsive force to launch the CEV and other mission elements into LEO.

Crew Exploration Vehicle:

Will provide the necessary crew habitation and health maintenance functions from launch to lunar orbit and return to the Earth surface, including aborts during Earth ascent. The CEV also will provide the necessary propulsive accelerations to return the mission crew from lunar orbit, independent of orbital alignment, for direct entry at Earth. The CEV will rendezvous and dock with other mission elements, such as the EDS and LSAM, in both LEO and lunar orbit. In addition, the CEV will operate un-crewed in lunar orbit while the crew is on the surface of the Moon.

Earth Departure Stage(s):

Will provide the necessary propulsive accelerations needed to transfer the various flight elements (CEV, LSAM, and cargo vehicles) from LEO to lunar orbit and provide the deceleration for lunar orbit insertion.

Lunar Surface Access Module:

Will provide the necessary crew habitation and transportation functions from lunar orbit to the lunar surface, and return to lunar orbit. In addition, the LSAM will provide the capability for the crew to perform EVA on the surface of the Moon in order to transition to the surface elements for the long duration missions. The LSAM will remain on the surface of the Moon during the long-duration surface missions.

Cargo Delivery System:

Will deliver un-crewed elements of the Crew Transportation System into Low Earth Orbit and/or lunar orbit. CDS elements include the Cargo Launch Vehicle and the EDS. The CDS will also deliver elements of the DSS from a low lunar orbit to the desired location on the surface of the Moon. The CDS

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 9 of 45

elements have not been completely identified at this time, but should include a Cargo Launch Vehicle, Cargo Destination Landing System, and the EDS.

Destination Surface System:

Will provide crew support capabilities to enable long-duration surface missions. The elements that comprise this system have not been completely defined at this point, but will provide functionality including habitation, communication, power, extended range mobility, enhanced science capabilities, etc. DSS will provide the capability for the crew to conduct long-duration surface science, and perform EVA on the surface of the Moon.

Robotic Precursor System:

Will provide measurements, technology demonstrations, and may provide infrastructure in advance of human missions.

Ground Support System:

Ground based facilities and capabilities will provide the ability to plan, test, train, process, launch, operate flight systems, as well as land, recover, refurbish or dispose of those systems.

3.1 Mission Definition

CTS0010A The CTS shall launch a CEV to LEO, conduct operations in LEO, and return the CEV to Earth.

Rationale : This requirement is the first increment in the spiral development approach specified in the Level 0 Exploration Requirements. Exploration will be implemented in stages or “spirals” using evolving modular components to respond to new opportunities without costly redesign. Capabilities and infrastructure developed in early spirals are utilized to test and emplace systems needed for subsequent spirals. In addition, early spirals serve as the building blocks for subsequent spirals, capitalizing on new technologies and operational concepts gained from previous missions. Establishing the capability to safely deliver and return mission crews to and from LEO as an initial step in further exploration endeavors is a key objective.

CTS0015A The CTS shall provide the capability to conduct missions with 0, 1, 2, 3, and 4 (**TBR-13**) crew members (threshold), with an objective of 5 and 6 (**TBR-15**) crew members.

Rationale : The requirement is intentionally written so that the CTS will be capable of operating in LEO with no crew or with anywhere from 1-4 crew, with the same objective as the lunar exploration missions (5 and 6 crew). This could impact center of gravity (CG) envelopes including those for a passive return capability. The 4 person crew is intended to demonstrate the minimum capability required for long duration lunar surface exploration. The number of crew required is driven by the expected tasks that must be performed, the skill mix of the mission crews, and the time and frequency provided to conduct the tasks. Studies have shown that a crew size of four provides the minimum mission flexibility and skill mix for the variety of tasks to be performed on the surface of the Moon during a long duration mission. A four person crew is the minimum number required to demonstrate operations concepts for exploring more distant destinations such as Mars. A 4 person crew allows 2 EVA teams (2 crew per

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 10 of 45

team) to operate simultaneously or in series with operational assistance from the non-EVA crew. Analysis to date strongly supports the threshold crew size of 4. The objective of 5 and 6 is still under review pending further analysis for launch vehicle and other element impacts.

References: ESMD-RQ-0005, "Lunar Architecture Focused Trade Study Final Results", ESMD-RQ-0006, "Lunar Architecture Broad Trade Study Final Results", ESMD-RQ-0015, "STTP-1 Meeting Minutes", ESMD-RQ-0016, "STTP-2 Meeting Minutes."

TBR-13 and TBR-15 Closures: Additional data to support this requirement will be developed during the CE&R studies. Issue to be resolved no later than 90 days prior to the CEV SRR. Further surface scenario assessments are required during the CE&R study phase. This issue will be resolved no later than 90 days prior to the CEV System Requirements Review.

3.2 Mission Success

CTS0030H The CTS shall provide single failure tolerance to loss of mission and critical hazards, except where the CTS meets NASA approved "Design for Minimum Risk" Criteria.

Rationale : This requirement establishes the failure tolerance design criteria for the system against the loss of successful mission completion, non-life-threatening injuries, or significant damage to the system. NASA Procedural Requirement (NPR) 8705.2 has failure tolerance criteria to prevent loss of life, however it does not provide measures to preclude loss of other mission assets. Although aborts and crew escape systems help to ensure survival of the crew and other personnel, loss of high value hardware and the additional risk of relaunching the crew could jeopardize completion of a mission. This requirement ensures robustness is built into the system through tolerance to failures. The Exploration System of Systems Programmatic Requirements detail the "Design for Minimum Risk" Criteria.

CTS0660H The CTS shall be designed to operate in the natural environments defined in the ESS NEDD document, sections (TBD-101).

Rationale : Compliance with the ESS NEDD will ensure that CTS flight systems will operate in the relevant natural environments during mission operations. The sections specified for CTS applicability are tied to the Earth-vicinity, Cislunar, Lunar-vicinity, and Lunar surface natural environments, for Spiral 1-3 missions.

3.3 Performance Characteristics

CTS0060A The CTS shall operate the CEV in the Earth Reference Orbit.

Rationale : A common Earth Reference Orbit (defined in the glossary) is identified because multiple element requirements depend upon a common reference orbit, and this orbit must be defined at the system level for subsequent allocation to each element's requirement set. Launches into 28.5 degree inclination orbits allow the maximum payload to orbit from the Eastern Range, while allowing launches from other locations at lower latitudes. The assembly altitude is specified to minimize the effects of atmospheric drag on orbital lifetime and provide repeating ground-tracks useful in achieving a consistent daily phase window. Spiral 1 should demonstrate the CEV capability to operate in this reference orbit, which will be used in subsequent spirals for assembly of exploration elements. The CEV will be required in future

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 11 of 45

spirals to rendezvous and dock with other exploration elements in this reference orbit.

Reference: ESMD-RQ-0017, “Orbital Characteristics Required for Rendezvous and Assembly of Exploration Initiative Elements”.

CTS0050H The CTS shall provide the capability to monitor, command, and control its system segments and elements.

Rationale : This requirement serves as the parent for lower level requirements which will specify command and control by mission control and the crew. Mission success and the safety of the flight crew, ground personnel and the general public will be dependent on the ability of the CTS to monitor, command and control the system, segments, and mission elements. One example is the capability required for public safety and the ability of the Range Safety System to track launch vehicle trajectory and performance and issue flight termination commands if required. Another example is the ability to detect and annunciate mission and safety critical conditions, isolate the conditions, and provide for recovery of mission and safety critical functions.

CTS0075H The CTS shall provide automated control linked to the mission phase and function, with an objective of automated operations throughout the mission.

Rationale : A high degree of automation is desired for the CTS to minimize the number of routine tasks required of the crew and mission control personnel. The cost of automation must be balanced against development cost, schedule, and technical risk. The long term costs of training personnel to do functions that could be automated must be assessed as part of any decision to automate. This requirement is a broadly defined parent for lower-level requirements that will specify levels of automation.

CTS0300H The CTS shall provide autonomous operations linked to the mission phase and function with an objective of autonomous operations throughout the mission.

Rationale : A high degree of CTS autonomy from ground control is desired for the CTS. Autonomy is required for functions for which there is not reasonable time for response from mission control. A defined methodology should be applied to each mission phase and vehicle function to determine how much autonomy is needed, and to assess where it is cost effective. This requirement serves as a broadly defined parent for lower level requirements that will specify the level of autonomy.

CTS0320H The CTS shall provide manual intervention of automated functions critical to mission success and crew safety.

Rationale : Manual intervention of automated control can be executed by ground control personnel or the crew. Human intervention capability is required to ensure that automated functions do not perform actions that are inappropriate in a particular failure scenario. For example, previous system or sensor failures may make an automated response undesirable. The requirement specifically does not say "all automated functions" - that determination is left to the program. Crew intervention requirements for crew safety are specified in NPR 8705.2, this requirement extends manual intervention to cover mission success.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 12 of 45

3.3.1 Operations

CTS0090H The CTS shall provide consumables margins to protect for delays in executing mission events.

Rationale : Reserve margins are needed to allow for unplanned events that cause mission extension beyond the originally planned duration. This will drive consumables levels and sizing for the vehicles. Consumables include propellant (for Delta-V and attitude control), power, habitation, and crew consumables. This requirement specifically does not specify all events - lower level requirements will specify events to be covered. This requirement will serve as the parent requirement to trace specific contingency capability requirement for each element.

3.3.2 Flight Control (Reserved)

3.3.3 Communications (Reserved)

3.3.4 Crew Environment

CTS0115H The CTS shall limit accelerations and rotational rates on the crew in accordance with NASA Standard 3000, Volume I, Section 5.3 (**TBR-72**).

Rationale : Axial and rotational acceleration rates imparted to the crew must be limited to acceptable levels to safely transport the crew. The acceptable acceleration rates are documented in NASA STD 3000.

TBR-72 Closure: NASA STD 3000 does not currently account for acceleration rates required to preserve crew life in the event of an abort or escape. Updates to NASA STD 3000 are required prior to CEV Request for Proposals (RFP) release.

CTS0116H The CTS shall provide the net habitable volume necessary for simultaneous crew activities as required by the mission phase.

Rationale : The necessary habitable volume is dependent on required crew activities. Simultaneous crew operations are required so that a critical activity is not interrupted by the need to perform another time critical activity. Examples of crew activities include trajectory monitoring and control, systems management, suit doffing and donning, waste management, etc. Habitable volume per person shall not include stowage and logistics space (i.e., net of crew consumables and other stowage space).

CTS0117H The CTS net habitable volumes shall comply with the requirements in NASA Standard 3000, Volume I, Section 8 (**TBD-2**).

Rationale : NASA 3000 sets the minimum habitable volume based on mission duration.

TBD-2 Closure: Updates to NASA Std 3000 are required prior to RFP release. If not updated, delete requirement.

CTS0238H The CTS habitable environments shall be maintained in accordance with the Constellation Systems interface standards document. (**TBD-66**).

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 13 of 45

Rationale : The CTS will likely have multiple habitable elements with common environments. The environmental standards (such as pressure, percentage oxygen, temperature, humidity, etc.) must be specified at the Constellation Systems level. The CEV is the first element that will comply with this interface document.

TBD-66 Closure: Interface standards must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

3.3.5 Software

CTS0270H The CTS shall comply with NPR 7150, NASA Software Engineering Requirements.

Rationale : NPRs are agency level requirements and not at the discretion of the Directorate.

3.4 Safety

3.4.1 General

CTS0140H The CTS shall comply with NPR 8705.2, Human Rating Requirements and Guidelines for Space Flight Systems.

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. In order to fly humans in space, each element of the System of Systems that interfaces with the crew is required to be certified as human-rated. NPR 8705.2 delineates the requirements and process for obtaining that certification and is applicable to those elements that interact with the crew. The current version is NPR 8705.2, with Change 2 dated 6/25/04. The document is currently under review and a new, approved version is expected prior to release of the CEV RFP.

CTS0150H The CTS shall comply with NPR 8715.3, NASA Safety Manual.

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. This document contains the requirements and procedures that define the NASA Safety Program for minimizing the risk to personnel and equipment.

CTS0160H The CTS shall comply with NASA STD 8719.13, Software Safety Standard, for all Safety-Critical Software.

Rationale : Software is a critical component of all complex space systems. Safety Critical Software (as defined in NASA-STD-8719.13) must be developed and tested to ensure the safety of the crew. Although 8719.13 is a standards document, it contains specific software requirements.

CTS0170H The CTS, when launching from U.S. Ranges, shall comply with NPR 8715.X (**TBD-65**), NASA Range Safety Program.

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. Space systems launched from US ranges are required to comply with Air Force Range Requirements as tailored for the system. The Range Safety NPR will contain the NASA tailored requirements to launch from US Ranges.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 14 of 45

TBD-65 Closure: The NPR is currently in the NASA Online Directive Information System (NODIS) review cycle, with OSMA responsibility. Completion is expected in early 2005.

CTS0650H The CTS shall dispose of expendable flight elements at end of life in accordance with NPD 8710.3, NASA Policy for Limiting Orbital Debris Generation.

Rationale : Disposal of any flight hardware that may generate orbital debris in Earth orbit, or may reenter the Earth's atmosphere are governed by this NPD. Abort towers, ascent stages, and earth departure stages are examples of potential flight hardware covered by this NPD.

3.4.2 Crew Survival

CTS0180H The CTS shall provide dual failure tolerance to catastrophic hazards, including permanent disability or loss of life, except where the CTS meets NASA approved "Design for Minimum Risk" criteria.

Rationale : This requirement establishes the failure tolerance design criteria for the system against all types of catastrophic hazards. NPR 8705.2 has failure tolerance criteria to prevent loss of life and permanent disability, however it does not provide measures to preclude other type of catastrophic hazards, loss of major vehicle segments or major facilities. Failure to mitigate against these hazards puts the crew and personnel at risk, as well as loss of high value strategic assets. The ESS Technical Requirements detail the "Design for Minimum Risk" Criteria (ESMD-RQ-0021).

CTS0210A The CTS shall provide for abort capability from the time the hatch is closed on the launch pad until CEV insertion into Earth Reference Orbit.

Rationale : The ESS Programmatic Guidelines state: "During ascent from the Earth's surface and Earth entry, the CTS should provide, to the maximum extent practical, for crew survivability in the event of catastrophic events." This Spiral 1 requirement will demonstrate critical fault detection and isolation techniques required for safe human space travel.

CTS0215A The CTS shall provide contingency return from LEO's up to the Earth Reference Orbit.

Rationale : During operations in LEO, the CTS must provide for contingency return of the crew to Earth in the event of failures that preclude mission continuation or threaten the safety of the crew. This is particularly important during the test and demonstration of the CEV.

CTS0125H The CTS shall provide for contingency EVA during operations in Earth orbit. **(TBD-33)**

Rationale : Contingency EVA capability was specifically identified by the Operations Advisory Group (OAG) as a high priority capability.

TBD-33 Closure: TBD applies to the entire requirement and whether this is a required capability. Specific contingency tasks cannot be identified until the CTS elements have been designed. Therefore, this requirement will remain TBD, pending further study.

CTS0220H Upon return to Earth, the CTS shall provide 36 hours **(TBR-35)** of crew survival after landing.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 15 of 45

Rationale : The CTS must provide crew survival capability while awaiting rescue. The requirement to rescue the crew following an abort will be part of the Ground Support System requirements. It is possible that for some aborts into the Atlantic Ocean, the first response forces to arrive would provide additional survival equipment until additional forces arrive to recover the crew. This requirement is exclusive of consumables margins specified in CEV0085H.

TBR-35 Closure: Closure of this item will be achieved no later than 90 days prior to the CEV System Requirements Review.

3.4.3 Vehicle Health

CTS0190H The CTS shall automatically detect and annunciate conditions which could result in loss of human life, loss of vehicle, loss of mission, or significantly impact mission capability.

Rationale : This requirement captures functionality, such as Integrated Health Management, for the detection of system failures. For situational awareness, the crew and mission control must be aware of significant changes in vehicle status, even if automated systems respond to the condition. This requirement intentionally does not specify all failures - which is not practical. Also, it is left to the program to interpret "significantly impact mission capability" in the lower level requirements. This requirement serves as a parent to flight element health status monitoring requirements. This capability is required during flight operations, and ground operations (e.g., during ground test).

CTS0200H The CTS shall provide autonomous isolation and recovery, with an objective of automated isolation and recovery, from conditions which could result in loss of human life or loss of vehicle.

Rationale : This requirement captures functionality, such as Integrated Health Management and redundancy management, for the detection and mitigation of system failures. Reliance on communication with mission control to avoid loss of vehicle or loss of life is not acceptable. Automated recovery should be used when practical, and for all cases where the time required for human response will not prevent the loss. The requirement specifically does not say all failures - since this is not practical. It is intentionally left to the program to determine what failures can be isolated and recovered. This capability is required during flight operations, and ground operations (e.g., during ground test).

A defined methodology should be applied to each mission phase and vehicle function to determine how much automation is needed, and where automation is cost effective. This requirement serves as the parent for lower level requirements that must be established using this approach.

CTS0230H The CTS shall provide isolation and recovery from conditions which could result in loss of mission or significantly impact mission capability.

Rationale : Recovery for failures which could result in loss of crew or vehicle is covered in a separate requirement. This requirement will serve as a parent requirement for lower level implementation of systems (i.e. vehicle health management systems etc.) to ensure that failures which could impact mission success or capability are addressed. This requirement intentionally does not specify all conditions - which is not practical.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 16 of 45

CTS0045H The CTS shall capture, archive, and make retrievable, mission and safety critical performance data.

Rationale : The ability to capture mission and safety critical performance data, and archive it in a retrievable format is necessary to support real-time anomaly resolution and post-mission data analysis.

3.5 Interfaces

CTS0240H The CTS shall provide communication in accordance with the Constellation Systems interface standards document. **(TBD-66)**.

Rationale : The complexity of possible architectures and the serial acquisition of exploration elements dictates a standard communications interface between all elements of the Exploration System of Systems. "Communication" includes command, data, voice and video. Constellation Systems must define the standard communications system to include bandwidth, rates, security, etc.

TBD-66 Closure: Interface standards must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CTS0250H The CTS interface with the Ground Support System shall comply with the requirements of the CTS / Ground Support System IRD **(TBD-67)**.

Rationale : The CTS will interface with Ground Support Systems such as Mission Control, launch site processing, launch control, and recovery / rescue forces.

TBD-67 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CTS0260H The CTS interface with the In-Space Support System shall comply with the requirements of the CTS / In-Space Support System IRD **(TBD-68)**.

Rationale : The CTS will interface with the In-Space support System such as communications satellite systems and navigation satellite systems. The CEV is the first CTS element that will comply with this interface document.

TBD-68 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 17 of 45

3.6 (Reserved)

3.7 Subordinate Elements

3.7.1 Crew Exploration Vehicle Launch Segment (CEVLS)

3.7.1.1 Mission Definition

CVS0010H The CEVLS shall deliver a Crew Exploration Vehicle (CEV) to an Earth Ascent Target Orbit.

Rationale : This is the primary function of the CEVLS. A mission capable CEV must be placed into an orbit from which the CEV is capable of completing the mission. The first mission objective for the CEV will be to rendezvous and dock with the other elements of the CTS. The CEVLS must insert the CEV into an orbit that reflects the navigational accuracy, launch window and orbital characteristics necessary to complete future Exploration missions.

References: ESMD-RQ-0005, "Lunar Architecture Focused Trade Study Final Results", ESMD-RQ-0006, "Lunar Architecture Broad Trade Study Final Results", ESMD-RQ-0015, "STTP-1 Meeting Minutes", ESMD-RQ-0016, "STTP-2 Meeting Minutes."

CVS0120H The CEVLS shall provide the capability to launch a CEV to the Earth Ascent Target Orbit with 0, 1, 2, 3, and 4 (**TBR-13**) CEV crew members, with an objective of 5 and 6 CEV crew members (**TBR-15**).

Rationale : The requirement is intentionally written so that the CEVLS will be capable of operating with or without crew. This requirement also specifies the capability to operate with any number of crew less than a full complement; this could have Center of Gravity (CG), configuration, and operational implications.

Capability provides necessary CTS functionality to execute a contingency/crew rescue mission with 0 crew (parent is CTS0405G). Verification of this requirement for the CEV Launch Segment will occur during Spiral 1.

References: ESMD-RQ-0005, "Lunar Architecture Focused Trade Study Final Results", ESMD-RQ-0006, "Lunar Architecture Broad Trade Study Final Results", ESMD-RQ-0015, "STTP-1 Meeting Minutes", ESMD-RQ-0016, "STTP-2 Meeting Minutes."

TBR-13 and TBR-15 Closure: Additional data to support this requirement will be developed during the CE&R studies. Issue to be resolved no later than 90 days prior to the CEV SRR.

3.7.1.2 Mission Success

CVS0030A The CEVLS shall provide a predicted ascent success probability to the Earth Ascent Target Orbit of 0.99325 (**TBR-36**) at 50% (**TBR-37**) confidence with an objective of 0.99325 (**TBR-36**) at 65% (**TBR-39**) confidence.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 18 of 45

Rationale : The threshold ascent success number is designed to assure that the CEVLS achieve a predicted analytical reliability that is at least as good as present day human-rated systems. This is reasonable expectation, given that the next human launch system should in fact provide an improved predicted analytical reliability over that of current system, with progressive increases in the level of confidence as the system is operated over a period of several years. The increase in confidence level is evenly divided among the three spirals with an ultimate objective of 95% confidence. To ensure continued advances in system reliability and safety, the objective of a given spiral becomes the threshold of the subsequent spiral.

TBR-36, TBR-37, TBR-38 and TBR-39 Closures: The TBRs in this requirement will require Agency-level approval to finalize.

CVS0032H The CEVLS shall provide single failure tolerance to loss of mission and critical hazards, except where the CEVLS meets NASA approved "Design for Minimum Risk" Criteria.

Rationale : This requirement establishes the failure tolerance design criteria for the system against the loss of successful mission completion, non-life-threatening injuries, or significant damage to the system. NPR 8705.2 has failure tolerance criteria to prevent loss of life, however it does not provide measures to preclude loss of other mission assets. Although aborts and crew escape systems help to ensure survival of the system's crew and other personnel, loss of high value hardware and the additional risk of relaunching the crew could jeopardize completion of a mission. This requirement ensures robustness is built into the system through tolerance to failures. The ESS Programmatic Requirements detail the "Design for Minimum Risk" criteria (ESMD-RQ-0021).

CVS0661H The CVS shall be designed to operate in the natural environments defined in the ESS NEDD document, sections **(TBD-101)**.

Rationale : Compliance with the ESS NEDD will ensure that the CEVLS will operate in the relevant natural environments during mission operations. The sections specified for CVS applicability are tied to Earth-vicinity natural environments, for Spiral 1-3 missions.

3.7.1.3 Performance Characteristics

CVS0050H The CEVLS shall provide the capability to monitor, command, and control the CLV and CEV.

Rationale : Mission success and the safety of the flight crew, ground personnel and the general public will be dependent on the ability of the CEVLS to monitor, command and control CEV and CLV. A critical capability required for public safety is the ability of the Range Safety System to track launch vehicle trajectory and performance and issue flight termination commands if required. Another example is the ability to detect and annunciate mission and safety critical conditions, isolate the conditions, and provide for recovery of mission and safety critical functions.

CVS0060H The CEVLS shall provide automated control of the vehicle from lift off until CEV insertion into the Earth Ascent Target Orbit.

Rationale : Automated control is required during the dynamic launch phase. The launch environment is not conducive to manual crew action to perform operations, and in the dynamic flight phase it is not appropriate to have routine ground control of the vehicle due to the potential for quick

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 19 of 45

response times and possible communications outages.

CVS0080H The CEVLS shall provide automated control of vehicle functions critical to crew safety during aborts.

Rationale : Automated control is required for critical functions during launch segment aborts from automatic detection of the abort condition through landing, including landing site selection. The abort environment is not conducive to manual crew action to perform operations, and in the dynamic flight phase it is not appropriate to have routine ground control of the vehicle due to the potential for quick response times, and possible communications outages.

CVS0090H The CEVLS shall provide manual intervention capability of automated functions critical to mission success and crew safety.

Rationale : Manual intervention of automated control can be executed by ground control or flight crew. Human intervention capability is required to ensure that automated functions do not perform actions that are inappropriate in a particular failure scenario. For example, previous system or sensor failures may make an automated response undesirable. This requirement specifically does not say "all automated functions" - that determination is left to the program. The requirement for manual intervention of functions critical to crew survival is covered in NPR 8705.2. This requirement is specific to mission success.

3.7.1.3.1 Operations

CVS0210H The CEVLS shall be available to support the next CEVLS launch opportunity following a launch scrub due to weather.

Rationale : The Launch System will require a timely recovery capability from environmental and technical issues to efficiently utilize available launch opportunities and minimize impacts to Exploration system elements. Incorporating robustness into the Launch System will drive redundancy and reliability requirements and technical and consumables margins.

This requirement intentionally does not say all launch scrubs as it is recognized that some technical problems will require more time to resolve. The intent is that the CEVLS design be capable of supporting the next CEVLS launch opportunity, when the scrub is due to weather or environmental factors. This capability can also be utilized when the scrub is due to a technical failure that is recoverable prior to the next opportunity.

3.7.1.3.2 Flight Control (Reserved)

3.7.1.3.3 Communications (Reserved)

3.7.1.3.4 Crew Environment

CVS0230H The CEVLS shall limit accelerations and rotational rates on the crew in accordance with NASA Standard 3000, Volume I, Section 5.3 (**TBR-72**).

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 20 of 45

Rationale : To safely transport the crew, both the axial and rotational acceleration rates imparted to the crew must be limited to acceptable levels. The acceptable acceleration rates are documented in NASA STD 3000.

TBR-72 closure: NASA STD 3000 does not currently account for acceleration rates that may be required to preserve crew life in the event of an abort or escape. Updates to NASA STD 3000 are required prior to CEV RFP release.

3.7.1.3.5 Software

CVS0240H The CEVLS shall comply with NPR 7150, NASA Software Engineering Requirements.

Rationale : NPRs are agency level requirements and not at the discretion of the Directorate.

3.7.1.4 Safety

3.7.1.4.1 General

CVS0250H The CEVLS shall comply with NPR 8705.2, Human Rating Requirements and Guidelines for Space Flight Systems.

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. In order to fly humans in space, each element of the System of Systems that interfaces with the crew is required to be certified as human rated. NPR 8705.2 delineates the requirements and process for obtaining that certification and is applicable to those elements that interact with the crew. The current version is NPR 8705.2, with Change 2 dated June 25, 2004. The document is currently under review and a new, approved version is expected prior to release of the CEV RFP.

CVS0260H The CEVLS shall comply with NPR 8715.3, NASA Safety Manual.

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. This document contains the requirements and procedures that define the NASA Safety Program for minimizing the risk to personnel and equipment.

CVS0270H The CEVLS shall comply with NASA STD 8719.13, Software Safety Standard, for all Safety-Critical Software.

Rationale : Software is a critical component of all complex space systems. Safety Critical Software (as defined in NASA-STD-8719.13) must be developed and tested to ensure the safety of the crew. Although 8719.13 is a standards document, it contains specific software requirements.

CVS0280H The CEVLS shall comply with NPR 8715.X, NASA Range Safety Program (**TBD-65**).

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. Space systems launched from US ranges are required to comply with Air Force Range Requirements as tailored for the system. The Range Safety NPR will contain the NASA tailored requirements to launch on US Ranges.

TBD-65 Closure: The NPR is currently in the NODIS review cycle, with OSMA responsibility.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 21 of 45

Completion is expected in early 2005.

CVS0651H The CEVLS shall dispose of expendable flight hardware at end of life in accordance with NPD 8710.3, NASA Policy for Limiting Orbital Debris Generation.

Rationale : Disposal of any flight hardware that may generate orbital debris in Earth orbit, or may reenter the Earth's atmosphere are governed by this NPD. Abort towers and ascent stages are examples of potential flight hardware covered by this NPD.

3.7.1.4.2 Crew Survival

CVS0290A The CEVLS shall provide a predicted ascent crew survival probability of 0.999325 (**TBR-40**) at 50% (**TBR-41**) confidence with an objective of 0.999325 (**TBR-40**) at 65% (**TBR-43**) confidence.

Rationale : The design, development, and operation of space transportation systems requires particular attention be paid to crew survival. The CAIB report stated, "Significant improvement in Earth-to-orbit crew transportation is required of future systems." In order to achieve a "significant improvement" crew survivability must be included from the beginning as a key design parameter of the CEVLS. The Astronaut Office crew survival white paper requirement is listed as 0.999 or better at 95% confidence. CVS0290A, an analytical requirement imposed at the outset of CEVLS conception, represents the kind of improvement necessary at this stage to achieve a significant improvement in an operational system. The use of abort/escape options will provide that significant improvement over current systems in operation. The increase in confidence level is evenly divided among the three spirals with an ultimate objective of 95% confidence. To ensure continued advances in system reliability and safety, the objective of a given spiral becomes the threshold of the subsequent spiral.

TBR-40, TBR-41, TBR-42 and TBR-43 Closures: The TBRs in this requirement will require Agency-level approval to finalize.

CVS0295H The CEVLS shall provide dual failure tolerance to catastrophic hazards, including permanent disability or loss of life, except where the CEVLS meets NASA approved "Design for Minimum Risk" criteria.

Rationale : This requirement establishes the failure tolerance design criteria for the system against all types of catastrophic hazards. NPR 8705.2 has failure tolerance criteria to prevent loss of life and permanent disability, however it does not provide measures to preclude other type of catastrophic hazards, such as debilitating injury, loss of major vehicle segments or major facilities. Failure to mitigate against these hazards puts the crew and personnel at risk, as well loss of high value strategic assets. The ESS Programmatic Requirements detail the "Design for Minimum Risk" criteria (ESMD-RQ-0021).

CVS0320H The CEVLS shall provide abort capability from the time the hatch is closed on the launch pad until the insertion of the CEV into the Earth Ascent Target Orbit.

Rationale : Abort capability throughout ascent has been proven feasible in previous programs. "Abort to orbit" is an acceptable abort provided the CEV has the capability to return safely to Earth following the "Abort to Orbit". This abort requirement includes all events required to return the crew safely to Earth in the entry spacecraft.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 22 of 45

3.7.1.4.3 Vehicle Health

CVS0300H The CEVLS shall detect and annunciate conditions which could result in loss of human life, loss of vehicle, loss of mission, or significantly impact mission or vehicle capability.

Rationale : This requirement captures functionality, such as Integrated Health Management, for the detection of system failures. For situational awareness, the crew and ground control must be aware of significant changes in vehicle status, even if automated systems respond to the condition. This requirement intentionally does not specify all failures - which is not practical. Also, it is left to the program to interpret "significantly impact mission or vehicle capability" in the lower level requirements. The requirement serves as a parent to flight element health status monitoring requirements.

CVS0310H The CEVLS shall provide autonomous isolation and recovery, with an objective of automated isolation and recovery, from conditions which could result in loss of human life or loss of vehicle.

Rationale : This requirement captures functionality, such as Integrated Health Management and redundancy management, for the detection and mitigation of system failures. Reliance on communication with mission control to avoid loss of vehicle or loss of life is not acceptable. Automated recovery should be used when practical, and for all cases where the time required for human response will not prevent the loss. The requirement specifically does not say all failures, since this is not practical. It is intentionally left to the program to determine what failures can be isolated and recovered.

A defined methodology should be applied to each mission phase and vehicle function to determine where automation is needed, where it is cost effective. This requirement serves as the parent for the lower level requirements that must be established using this approach.

CVS0340H The CEVLS shall provide isolation and recovery from conditions which could result in loss of mission or impact mission capability.

Rationale : Recovery from failures which could result in loss of crew or vehicle is covered in a separate requirement. This requirement will serve as a parent requirement for lower level implementation of vehicle health management systems, etc. to ensure that failures which could impact mission success or capability are addressed. This requirement intentionally does not specify all conditions - which is not practical.

CVS0046H The CEVLS shall capture, archive, and make available for retrieval, mission and safety critical performance data.

Rationale : The ability to capture mission and safety critical performance data, and archive it in a retrievable format is necessary to support real-time anomaly resolution and post-mission data analysis.

3.7.1.5 Interfaces

CVS0350H The CEVLS shall provide communication in accordance with the CTS IRD (**TBD-100**).

Rationale : The complexity of possible architectures and the serial acquisition of Exploration elements dictates a standard communications interface between all elements of the Exploration System of Systems. Communications includes command, data, voice and video. Constellation must define the

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 23 of 45

standard communications system to include bandwidth, rates, security, etc. The CEV and CLV are the first CTS elements that will comply with these interface standards.

TBD-100 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CVS0355H The CEVLS interface between the CLV and the CEV shall comply with CEVLS IRD (**TBD-87**).

Rationale : Interface definition between the CEV and the CLV.

TBD-87 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CVS0360H The CEVLS interface with the Ground Support System shall comply with the CTS / Ground Support System IRD (**TBD-67**).

Rationale : The CTS will interface with Ground Support System elements such as Mission Control and recovery/rescue forces. The CEV and CLV are the first CTS elements that will comply with this interface document.

TBD-67 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CVS0365H The CEVLS interface with the In-Space Support System shall comply with CTS / In-Space Support System IRD (**TBD-68**).

Rationale : The CTS could potentially interface with In-Space Support System communication elements. If such an interface exists, it must comply with the CTS to In-Space IRD.

TBD-68 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

3.7.2 Crew Exploration Vehicle (CEV)

3.7.2.1 Mission Definition

CEV0350A The CEV shall provide the capability to conduct missions with 0, 1, 2, 3, and 4 (**TBR-13**) crew members (threshold), with an objective of 5 and 6 crew members (**TBR-15**).

Rationale : The requirement is intentionally written so that the CEV will be capable of operating with or without crew. Also specifies the capability to operate with any less than a full complement of crew that could have CG, configuration, and operational implications. Crew size is derived from CTS requirements.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 24 of 45

TBR-13 and TBR-15 Closures: Additional data to support this will be developed during the CE&R studies. Issue to be resolved no later than 90 days prior to the CEV SRR.

CEV0010A The CEV shall operate in LEO from the Earth Ascent Target Orbit to the Earth Reference Orbit.

Rationale : It is an essential mission capability for the CEV to operate between various Earth orbits. Depending on the architecture, the CEV may be required to dock with an EDS as a demonstration of basic system performance characteristics to support future exploration objectives. This assembly orbit must be defined in order to design and develop the elements of the ESS. In Spiral 1 the CEV must be capable of getting to the assembly orbit, conducting operations in that orbit, and then returning to Earth.

References: ESMD-RQ-0005, "Lunar Architecture Focused Trade Study Final Results", ESMD-RQ-0006, "Lunar Architecture Broad Trade Study Final Results", ESMD-RQ-0015, "STTP-1 Meeting Minutes", ESMD-RQ-0016, "STTP-2 Meeting Minutes."

CEV0370A The CEV shall return to a designated landing site on Earth from LEOs up to the Earth Reference Orbit.

Rationale : Returning the CEV and crew to Earth from the various Earth orbits in which it must operate is a fundamental CEV mission requirement. Landing sites will be designated for end of mission return to facilitate recovery of the crew and systems.

3.7.2.2 Mission Success

CEV0040H The CEV shall provide single failure tolerance to loss of mission and critical hazards, except where the CEV meets NASA approved "Design for Minimum Risk" Criteria.

Rationale : This requirement establishes the failure tolerance design criteria for the system against the loss of successful mission completion, non-life-threatening injuries, or significant damage to the system. NPR 8705.2 has failure tolerance criteria to prevent loss of life, however it does not provide measures to preclude loss of other mission assets. Although aborts and crew escape systems help to ensure survival of the crew and other personnel, loss of high value hardware and the additional risk of relaunching the crew could jeopardize completion of a mission. This requirement ensures robustness is built into the system through tolerance to failures. The ESS Programmatic Requirements detail the "Design for Minimum Risk" criteria (ESMD-RQ-0021).

CEV0662H The CEV shall be designed to operate in the natural environments defined in the ESS NEDD document, sections (TBD-101).

Rationale : Compliance with the ESS NEDD will ensure that the CEV will operate in the relevant natural environments during mission operations. The sections specified for CEV applicability are tied to Earth-vicinity, Cislunar, and Lunar-vicinity natural environments, for Spiral 1-3 missions.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 25 of 45

3.7.2.3 Performance Characteristics

CEV0060A The CEV shall provide automated control of the vehicle during entry (both nominal and off-nominal), with an objective of automated control of the vehicle throughout the mission.

Rationale : Automated control is required during dynamic phases of flight. Automated control for entry includes de-orbit burn targeting and execution through atmospheric entry and landing. The objective of automated control throughout the mission is driven by the desire to reduce crew and ground personnel time spent on routine tasks, and should be implemented when the automation is cost effective.

CEV0050A The CEV shall provide autonomous return capability to Earth from Earth orbit, with an objective of autonomous operation throughout the mission.

Rationale : Autonomous control is required during the dynamic entry phase of flight. Autonomous operations for entry include targeting and entry burn through landing. The objective of autonomous operation during all mission phases is desirable when it is cost effective.

CEV0400H The CEV shall provide manual intervention of automated functions critical to mission success and crew safety.

Rationale : Manual intervention of automated control can be executed by ground control or flight crew. Human intervention capability is required to ensure that automated functions do not perform actions that are inappropriate in a particular failure scenario. For example, previous system or sensor failures have made an automated response undesirable. This requirement specifically does not say "all automated functions" - that determination is left to the program. The requirement for manual intervention of functions critical to crew survival is covered in NPR 8705.2.

3.7.2.3.1 Operations

CEV0085H The CEV shall provide 48 hours (**TBR-60**) of mission consumables to accommodate unplanned or contingency events, with an objective of 72 hours (**TBR-61**).

Rationale : The purpose of this requirement is to ensure that the CEV has the capability to accommodate delays during the entire mission to solve problems.

This requirement is exclusive of launch scrub turnaround requirements. In the event of a launch scrub, the CEV will require consumables replenishment to maintain the margins specified in this requirement. This requirement is also exclusive of requirements to support CEV loiter time in LEO to protect for launch delays (for example, if the CEV launches two days before the optimum launch time to account for potential CEV launch delays, then the consumables required to support the loiter time will not count towards the contingency consumables specified in this requirement).

48 hours is the standard used today in shuttle operations, but is driven primarily by landing constraints. For lunar exploration missions, the CEV will need to protect for a delay in the crew leaving the surface of the moon and potentially a delay in leaving lunar orbit to return to Earth. 24 hours for each situation provides adequate margin. In Spiral 1 missions, since the CEV is returning from Earth orbit to a designated landing site, the 48 hour delay will accommodate potential weather delays at the landing site. This requirement is also exclusive of the consumables necessary to satisfy CTS0220H and CEV0280H (Crew Survival capability of 36 hours after Earth landing). This 48 hours of additional consumables are margin above quantities specified in other requirements (e.g. CEV0611G).

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 26 of 45

TBR-60 and TBR-61 Closures: Closure of this item will be achieved no later than 90 days prior to the CEV SRR.

3.7.2.3.2 Flight Control

3.7.2.3.3 Communications

CEV0110H The CEV shall simultaneously communicate with a threshold of two (**TBR-77**) Exploration elements, objective (**TBD-68**).

Rationale : The CTS will require simultaneous communication with Mission Control (Ground Support System) and other Exploration elements such as launch control, EDS (Spirals 2 and 3), Destination Surface System mission elements (in Spiral 3), recovery forces, etc. This is a basic requirement driven by the complexity of the ESS. For example, a CEV performing rendezvous operations with an LSAM will require communications with Mission Control and the LSAM simultaneously. Communication includes voice, data, command, and video as specified in the IRD.

TBD-68 and TBR-77 Closures: Closure of this item will be achieved no later than 90 days prior to the CEV SRR.

3.7.2.3.4 Crew Environment

CEV0120A The CEV shall provide crew habitation from crew ingress on the surface of the Earth until crew egress after return to Earth.

Rationale : LEO D&T mission duration requirement will be specified by the CEV program in lower level requirements based on test and demonstration objectives. Regardless of the duration of the LEO mission, the CEV must provide the habitation function for the crew.

This requirement provides a parent for lower level crew habitation requirements, including volume, Environmental Control/Life Support System (ECLSS), food, water, and waste management. Crew habitation will be provided for the full Spiral 1 duration, once that duration is established.

CEV0612H The CEV net habitable volume shall comply with the requirements in NASA Standard 3000 (**TBD-2**).

Rationale : NASA 3000 sets the minimum habitable volume requirements based on mission duration

TBD-2 Closure: Updates to NASA Standard 3000 are required prior to CEV RFP release. If not updated, then this requirement will be deleted.

CEV0140H The CEV shall provide the net habitable volume for simultaneous crew activities necessary for the mission phase.

Rationale : The necessary habitable volume is dependent on required crew activities. Simultaneous crew operations are required so that a critical activity is not interrupted by the need to perform another time critical activity. Examples of crew activities include trajectory monitoring and control, systems

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 27 of 45

management, suit doffing and donning, waste management, etc. Habitable volume per person shall not include stowage and logistics space (i.e., net of crew consumables and other stowage space). The volume required for a short duration mission in LEO is different than the volume required for a mission to lunar orbit. Depending on the architecture, the CEV may not provide the habitable volume for the transit to and from the moon - therefore, this requirement is written to allow a minimum volume CEV architecture.

CEV0150H The CEV habitable environment shall be maintained in accordance with the CTS IRD (TBD-100).

Rationale : Habitable environment interface standards are required to document the habitable environments interface between joined habitable element volumes. The interface standard must set a common standard for mated O2 concentration, total system pressures, temperature and humidity. These values will affect parts and material selection in each element.

TBD-100 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CEV0130H The CEV shall limit accelerations and rotational rates on the crew in accordance with NASA Standard 3000, Volume I, Section 5.3 (TBR-72).

Rationale : To safely transport the crew, both the axial and rotational acceleration rates imparted to the crew must be limited to acceptable levels. The acceptable acceleration rates are documented in NASA STD 3000.

TBR-72 Closure: NASA STD 3000 does not currently account for acceleration rates that may be required to preserve crew life in the event of an abort or escape, and it is out of date for nominal forces. Updates to NASA STD 3000 are required prior to CEV RFP release.

3.7.2.3.5 Software

CEV0170H The CEV shall comply with NPR 7150, NASA Software Engineering Requirements.

Rationale : NPRs are agency level requirements and not at the discretion of the Directorate.

3.7.2.4 Safety

3.7.2.4.1 General

CEV0180H The CEV shall comply with NPR 8705.2, Human Rating Requirements and Guidelines for Space Flight Systems.

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. In order to fly humans in space, each element of the System of Systems that interfaces with the crew is required to be certified as human rated. NPR 8705.2 delineates the requirements and process for obtaining that certification and is applicable to those elements that interact with the crew. The current version is NPR 8705.2, with Change 2 dated June 25, 2004. The document is currently under review, and a new, approved version is expected prior to release of the CEV RFP.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 28 of 45

CEV0190H The CEV shall comply with NPR 8715.3, NASA Safety Manual.

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. This document contains the requirements and procedures that define the NASA Safety Program for minimizing the risk to personnel and equipment.

CEV0200H The CEV shall comply with NASA-STD-8719.13, Software Safety Standard, for all Safety-Critical Software.

Rationale : Software is a critical component of all complex space systems. Safety Critical Software (as defined in NASA-STD-8719.13) must be developed and tested to ensure the safety of the crew. Although 8719.13 is a standards document, it contains specific software requirements.

CEV0210H The CEV, when launching from a U.S. range, shall comply with NPR 8715.x, NASA Range Safety Program (**TBD-65**).

Rationale : NPRs are Agency level requirements and not at the discretion of the Directorate. Space systems launched from US ranges are required to comply with Air Force Range Requirements as tailored for the system. The Range Safety NPR will contain the NASA tailored requirements to launch on US Ranges.

TBD-65 Closure: The NPR is currently in NODIS review cycle, with OSMA responsibility. Completion is expected in early 2005.

CEV0652H The CEV shall dispose of expendable flight hardware at end of life in accordance with NPD 8710.3, NASA Policy for Limiting Orbital Debris Generation.

Rationale : Disposal of any flight hardware that may generate orbital debris in Earth orbit, or may reenter the Earth's atmosphere are governed by this NPD. Abort towers are examples of potential flight hardware covered by this NPD.

3.7.2.4.2 Crew Survival

CEV0220H The CEV shall provide dual failure tolerance to catastrophic hazards, including permanent disability or loss of life, except where the CEV meets NASA approved "Design for Minimum Risk" criteria.

Rationale : This requirement establishes the failure tolerance design criteria for the system against all types of catastrophic hazards. NPR 8705.2 has failure tolerance criteria to prevent loss of life and permanent disability, however it does not provide measures to preclude other type of catastrophic hazards, such as non-debilitating injury, loss of major vehicle segments or major facilities. Failure to mitigate against these hazards puts the crew and personnel at risk, as well loss of high value strategic assets. The programmatic requirements detail the "Design for Minimum Risk" criteria.

CEV0260H The CEV shall provide abort capability to return to Earth at any time from LEO's up to the Earth Reference Orbit.

Rationale : CEV provides capability to abort the mission and return to Earth at any point during Earth orbit operations.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 29 of 45

CEV0280H The CEV shall provide for 36 hours (**TBR-35**) of crew survival after landing.

Rationale : The CEV must provide for survival capability while awaiting rescue. The requirement to rescue the crew following an abort will be part of the Ground Support System requirements. It is possible that for some aborts into the Atlantic Ocean, the first arrival of rescue forces would provide additional survival equipment until recovery forces arrive. This requirement is exclusive of consumables margins specified in CEV0085H.

TBR-35 Closure: This issue will be closed no later than 90 days prior to CEV System Requirements Review.

CEV0320H The CEV shall provide for contingency EVA. (**TBD-86**)

Rationale : Contingency EVA was identified by the OAG as a required capability.

TBD-86 Closure: TBD applies to the entire requirement. Specific contingency tasks have not been identified for the CEV. Therefore, this requirement will remain TBD, pending further study.

3.7.2.4.3 Vehicle Health

CEV0230H The CEV shall detect and annunciate conditions that could result in loss of human life, loss of vehicle, loss of mission, or significantly impact mission capability.

Rationale : This requirement captures functionality, such as Integrated Health Management, for the detection of system failures. For situational awareness, the crew and ground control must be aware of significant changes in vehicle status, even if automated systems respond to the condition. This requirement intentionally does not specify all failures - which is not practical. Also, it is left to the program to interpret "significantly impact mission capability" in the lower level requirements. This requirement serves as a parent to flight element health status monitoring requirements. This capability is required during flight operations, and ground operations (e.g., during ground test).

CEV0240H The CEV shall provide autonomous isolation and recovery, with an objective of automated isolation and recovery, from conditions which could result in loss of human life or loss of vehicle.

Rationale : This requirement captures functionality, such as Integrated Health Management and redundancy management, for the detection and mitigation of system failures. Reliance on communication with mission control to avoid loss of vehicle or loss of life is not acceptable. Automated recovery should be used when practical, and for all cases where the time required for human response will not prevent the loss. The requirement specifically does not say all failures - since this is not practical. It is intentionally left to the program to determine what failures are can be isolated and recovered. This capability is required during flight operations, and ground operations (e.g., during ground test).

A defined methodology should be applied to each mission phase and vehicle function to determine how much automation is needed, and where automation is cost effective. This requirement serves as the parent for lower level requirements that must be established using this approach.

CEV0290H The CEV shall provide isolation and recovery from conditions which could result in loss of mission or significantly impact mission capability.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 30 of 45

Rationale : Isolation and recovery for failures which could result in loss of crew or vehicle is covered in a separate requirement. This requirement will serve as a parent requirement for lower level implementation of vehicle health management systems, etc. to ensure that failures which could impact mission success or capability are addressed. This requirement intentionally does not specify all conditions - which is not practical.

CEV0047H The CEV shall capture, archive, and make available for retrieval, mission and safety critical performance data.

Rationale : The ability to capture mission and safety critical performance data, and archive it in a retrievable format is necessary to support real-time anomaly resolution and post-mission data analysis.

3.7.2.5 Interfaces

CEV0300H The CEV shall communicate in accordance with the CTS IRD (**TBD-100**).

Rationale : The complexity of possible architectures and the serial acquisition of Exploration elements dictates a standard communications interface between all elements of the Exploration System of Systems. Communications includes command, data, voice and video. Constellation Systems must define the standard communications system to include bandwidth, rates, security, etc.

TBD-100 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CEV0310H The CEV interface with Ground System shall comply with the CTS/ Ground Support System IRD (**TBD-67**).

Rationale : The CEV will interface with Ground Support Systems such as Mission Control, launch site processing, launch control, and recovery / rescue forces.

TBD-67 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CEV0335H Upon return to Earth, the CEV shall provide the interfaces required for recovery of the crew and CEV, in accordance with the CTS / Ground Support System IRD (**TBD-67**).

Rationale : The CEV must provide interfaces necessary to allow recovery forces to ingress the vehicle, lift the CEV, etc.

TBD-67 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD Requirements Division.

CEV0095H The CEV interface with the In-Space Support System shall comply with the CTS / In-Space Support System IRD (**TBD 68**).

Rationale : The CEV will need to interface with in-space communication and navigation systems. This interface is specified in the applicable IRD.

TBD-68 Closure: This IRD must be developed by Constellation Systems, in coordination with the ESMD

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 31 of 45

Requirements Division.

4 Verification (Reserved)

5 Appendices

5.1 Glossary

Abort Termination of the nominal mission that allows the crew to be returned to Earth in the portion of the space system used for nominal reentry and touchdown (see Abort to Earth, Abort to Orbit).

Abort to Earth Early mission termination, with direct return to the Earth's surface as the immediate objective.

Abort to Orbit An early mission termination that has an immediate objective of placing a crewed flight system in Earth (or destination vicinity) orbit, prior to return to the Earth's surface.

Annunciate To provide a visual, tactile or audible indication.

Ascent The function of liftoff from the Earth (or mission destination) surface, to spacecraft insertion into Earth/destination orbit.

Automated control Automatic, as opposed to human operation or control of a process, equipment or a system; or the techniques and equipment used to achieve this. Automation is the control or execution of actions with no human interaction. Automated control does not exclude the capability for manual intervention / commanding, but manual intervention / commanding is explicitly not required to accomplish the function.

Autonomous experiments Defined as a flight experiments operating independent of external commands or control (i.e. commands from mission control on Earth). Autonomous experiments can be fully automated or require some degree of manual commanding/intervention.

Autonomous operations Defined as a flight vehicle operating independent of external communication, commands or control (i.e., commands from mission control on Earth). Autonomous operations can be fully automated or require some degree of manual commanding/intervention by the onboard crew. Autonomous operations that do not require onboard crew involvement are, by definition, automated; therefore, the term "autonomous operations" used in the requirements assumes onboard crew involvement in the operations.

Berthing A method of mating two or more Exploration elements in space. During a berthing operation, the two elements are mechanically connected prior to the structural capture and final mating (i.e., one element grapples the other with a robotic arm). One element controls the trajectory and attitude of the other element for the contact and capture. Final mating is generally performed by the berthing mechanism (also see docking).

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 32 of 45

Cargo Delivery System (CDS) The CDS encompasses the capability to deliver all non-CEV flight elements needed to accomplish human exploration objectives. At such time as CDS elements dock with the CEV, they are part of a human crew occupied system, and are considered part of the CTS.

Cargo Launch Vehicle The Cargo Launch Vehicle is an element of the Cargo Delivery System. The Cargo Launch Vehicle will perform the ascent function for non-crewed elements of the CTS (EDS, LSAM), into an Earth Orbit. Since the Cargo Launch Vehicle will not carry human crew, it will not require Human-Rating.

Catastrophic Hazard A condition that may cause death or permanently disabling injury, major system or facility destruction on the ground, or major systems or vehicle destruction during the mission. (From NPR 8715.3 Safety Manual)

Consumables Resources that are consumed in the course of conducting a given mission. Includes propellant, power, habitability items (e.g., gaseous oxygen), and crew supplies.

Contingency EVA Capability An EVA capability provided to deal with critical failures or circumstances, which are not adequately protected by redundancy or other means.

Crew Exploration Vehicle (CEV) The CEV provides crew habitation and Earth reentry capability for all Exploration Spirals.

Crew Exploration Vehicle Launch Segment (CEVLS) The CEVLS consists of a Crew Exploration Vehicle (CEV), a Crew Launch Vehicle (CLV), and all the dedicated ground support infrastructure necessary to launch the CEV to Earth orbit.

Crew Launch Vehicle (CLV) The CLV is an element of the CTS. The CLV will be human-rated, and will deliver the CEV into a mission-specific Earth Ascent Target Orbit.

Crew Member Human onboard the spacecraft or space system during a mission.

Crew Survival Capabilities designed to keep the crew alive through means such as abort, escape, safe haven, emergency egress, and rescue in response to a Catastrophic Hazard.

Crew Transportation System (CTS) The CTS encompasses the flight elements needed to deliver a human crew from Earth to a mission destination, and return the crew safely to Earth. The CTS must interact with the Ground Support System (GSS) during all Spirals; current architectures require delivery of the EDS and LSAM to Earth orbit through use of the CDS.

Critical Hazard A condition that may cause a severe injury or occupational illness, loss of mission, or major property damage to facilities, systems, or flight hardware.

Day Defined as an Earth day of 24 hours.

Destination Surface System (DSS) The DSS encompasses all elements (exclusive of the surface lander that transports the crew to the destination surface) necessary to enable a long-duration human exploration mission. Examples of DSS elements include a long-duration habitation module, surface

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 33 of 45

power capability, and surface transportation systems. DSS elements will be delivered to the destination surface via the CDS. It is likely that these assets will be pre-deployed in advance of the crew that will utilize them to execute a given Exploration mission.

Destination Surface to Destination Vicinity Phase Starts with the initiation of the ascent (T0) from the destination surface. Representative mission activities include: ascent, abort, and orbit insertion or libration capture. Phase ends after successful destination vicinity insertion/capture.

Destination Vicinity Operations Phase (A) Starts at the successful insertion/capture at the destination vicinity. Representative mission activities include: loiter and phasing, vehicle and system checkout, crew-cargo transfers, undocking and separation. Phase ends at the successful separation of surface lander system for descent burn.

Destination Vicinity Operations Phase (B) Starts after the successful destination orbit insertion or libration point capture, following ascent from destination surface. Representative mission activities include: phasing, vehicle-system checkout, crew-cargo transfer, undocking and separation maneuver, element disposal and/or safing. Phase ends at the completion of the Trans-Earth Injection burn.

Destination Vicinity to Earth Phase Begins with completion of Trans-Earth Injection burn and includes mid-course corrections, cruise to Earth vicinity, element separation and element disposal. Ends with arrival at Earth entry interface or insertion to Earth orbit.

Destination Vicinity to Destination Surface Phase Starts at the initiation of the descent burn from destination vicinity (destination deorbit burn or libration departure burn to destination). Representative mission activities include: descent to destination surface, descent aborts, landing, propulsion system shutdown and safing. For libration architectures, additional activities include orbit capture, phasing, and de-orbit maneuvers. Phase ends when the vehicle has completed all landing activities on the destination surface, including propulsion system shutdown and safing.

Docking A method of mating two or more Exploration elements in space. In a docking operation, the structural mechanisms are brought into contact and captured through independent control of the two vehicles' flight path and attitude. Final mating is generally accomplished by the docking mechanism (also see Berthing).

Earth Ascent Target Orbit The planned orbit, at conclusion of the ascent function.

Earth Departure Stage (EDS) EDS will be used to provide the propulsive force needed to transfer the various flight elements to destination phasing orbits (including the CEV and LSAM).

Earth-Moon Transit Transit of a spacecraft between Earth vicinity and Lunar vicinity in either direction.

Earth Orbit Operations Phase (A) Starts with completion of Earth orbit insertion. Representative activities include: phasing, rendezvous, docking and loiter. Ends with completion of a burn to leave Earth orbit (i.e., Trans-Lunar Injection burn or de-orbit burn).

Earth Orbit to Destination Vicinity Phase Starts after completion of vehicle injection burn (i.e.,

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 34 of 45

Trans-Lunar Injection) and includes mid-course corrections, element separation/disposal, and cruise to destination vicinity. Ends with successful insertion/capture at destination vicinity.

Earth to Orbit Phase Starts with liftoff. Representative activities include liftoff through ascent to orbit, ascent crew escape/abort and re-entry/descent during aborts, disposal of elements. Ends with insertion into a stable, 24 hour Earth orbit (i.e., at least 24-hour stability) or return to Earth (in the event of an abort).

Earth Re-entry Phase Direct re-entry returns from beyond Earth orbit begin with arrival at Earth entry interface; Earth-orbit Aerocapture return begins with completion of Earth orbit injection. In either case, phase includes descent through the atmosphere and ends with landing on the Earth's surface. This phase encompasses activities necessary to successfully execute direct-to-Earth aborts during ascent and direct entry return from beyond Earth orbit.

Earth Reference Orbit The orbit designated for assembly of Exploration System elements prior to departure for exploration destinations, defined by the following parameters: Inclination: 28.5-29.0 degrees; Launch Azimuth: 90+/- 5 degrees; Altitude: 307 km - 407 km.

Element A set of functional capabilities necessary to satisfy system-level mission objectives within a given architecture. CTS elements currently include the Crew Exploration Vehicle, Earth Departure Stage, and Lunar Surface Access Module. Elements can perform all system functions within a mission phase, or through mated operations with other exploration elements (as part of a segment).

Emergency Egress The timely and unassisted crew exit of a vehicle (i.e., in response to a Catastrophic Hazard).

Entry footprint Region on Earth's surface defined by the boundaries of the Earth entry corridor for a given vehicle.

Equatorial Region of the Moon Defined as the area between 0-20 degrees lunar latitude (threshold), with an objective of 0-30 degrees (TBR-7).

Escape Removal of crew from the failing spacecraft, due to an imminent catastrophic condition, thus placing them in a safe situation suitable for survivable return to Earth and rescue. Escape includes, but is not limited to, those capabilities that utilize a portion of the original space system for the removal (e.g., escape pods).

Exploration Spiral 1 (Crew Exploration Development and Test) Encompasses the capabilities necessary to insert humans into Earth orbit and return them safely to Earth, employing a post-Space Shuttle flight system. The flight elements of the Exploration Spiral 1 Crew Transportation System are the Crew Exploration Vehicle and Crew Launch Vehicle. Robotic Precursor Missions that are scheduled to launch prior to the Earth orbit demonstration of the Spiral 1 CTS are considered Exploration Spiral 1 missions.

Exploration Spiral 2 (Global Lunar Access for Human Exploration) Encompasses the capabilities necessary to execute human lunar exploration anywhere on the surface of the moon. Lunar global access exploration missions will be 4-7 days in duration on the lunar surface, and do not require pre-deployed

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 35 of 45

surface systems (e.g., Habitation Module or Surface Power). Robotic Precursor Missions scheduled to launch after the Spiral 1 CTS flight demonstration, and prior to the first Spiral 3 Lunar mission are considered Exploration Spiral 2 missions.

Exploration Spiral 3 (Lunar Base and Mars Testbed) Encompasses the capabilities necessary to execute a long-duration human lunar exploration campaign. This campaign requires development of extensive surface systems (e.g., habitation and surface power system). Robotic Precursor Missions that are scheduled to launch after the last Spiral 2 extended- duration lunar mission, and prior to the initial Exploration Spiral 4 mission are considered Exploration Spiral 3 missions.

Extended-Duration (Lunar Mission) Human missions to the lunar surface ranging from 4 days (96 hours) through 7 days. This capability is an objective of Exploration Spiral 2. Extended-duration lunar missions do not require pre-deployed Surface Systems (e.g., habitation modules or surface power system).

Extra-Vehicular Activity (EVA) Operations performed by crew members outside the pressurized environment of a flight vehicle or habitat (during space flight or on a destination surface).

Failure Tolerance Failure tolerance is a term used to describe minimum acceptable redundancy. It may also be used to describe similar systems, dissimilar systems, cross-strapping, or functional interrelationships that ensure minimally acceptable system performance despite failures. It is highly desirable that space flight systems performance degrades in a predictable fashion that allows sufficient time for failure detection and, when possible, system recovery even when experiencing multiple failures.

Genomics Genetic mapping and DNA sequencing of genes, with applications of the data in medicine or biology.

Geodetic Referenced to the global center of mass of any body (does not refer only to the Earth).

Ground Operations Phase Begins with the start of mission planning. Representative activities include: mission planning, training, receipt of government hardware/software, acceptance, test, checkout, repair, inspection, assembly, integration, servicing and countdown activities. Also includes ground contingency, emergency, abort and turnaround operations. Phase ends with vehicle liftoff.

Ground Support System This system provides all common ground-based capabilities (e.g., mission control, launch-site processing) needed to execute Exploration missions. Facilities and capabilities that are unique to a single Exploration System, such as the CTS, will be included as part of the system it supports.

Guidance and Control The process of directing the movements of a space vehicle, including selection of a flight path and making changes in attitude and speed.

Habitation The provision for and management of the crew environment (i.e., through the use of life support systems, thermal control, etc.) in a crewed vehicle or habitat.

In-Space Support System (IS³) Encompass capabilities provided by space-based infrastructure elements (e.g., communications, navigation, surveillance), that are placed in orbital or lunar/planetary locations, and their corresponding ground-based operation (e.g., a ground station or antenna). These

Exploration Systems Mission Directorate

	Effective Date: 24 Mar 2005	Page 36 of 45

capabilities are exclusive of those provided by elements of the DSS.

Inclination The angle between the plane of an orbit and a reference plane, most frequently the equator of the central body (e.g., the Earth's equator for geocentric orbits).

Independent Technical Authority (ITA) A responsibility owned by the NASA Chief Engineer, which is then delegated through the issuance of warrants. A warrant holder is designated as compliance officer over an identified set of engineering and technical requirements or standards.

Initial Lunar Phasing Orbit Used in Spiral 2 and 3 to define the orbit from which the CEV will assume delta V responsibility for inbound rendezvous and docking with the LSAM in lunar orbit. Defined by the following parameters: Altitude: 100 km x 500 km +/- (TBD-6) km (TBR-34); Maximum inclination error with respect to the Lunar Reference Orbit; 0.5 degrees (TBR-28).

Initial Operational Capability (IOC) The capability achieved when an element, segment, or system (e.g., the CEVLS) passes its initial Flight Readiness Review in connection with a given Exploration Spiral.

Integrated Logistics Support (ILS) Is an approach that enables disciplined, unified and iterative management of support considerations into system and equipment design. ILS includes development of support requirements that are related to readiness objectives, to design, and to each other. Requirements in turn drive acquisition of required support; ILS is then employed during the operational phase.

Launch Availability The likelihood that a given launch will be achieved without a scrub once the mission timeline (first element launch for a multiple launch mission) or the launch countdown call to stations (for a mission scenario involving a single launch) has commenced. Launch availability is composed of four elements: system availability, launch probability, launch site weather constraints and abort weather constraints. Launch Availability can be expressed as: $P(LA) = P(SA) \times P(LP) \times P(LW) \times P(AW)$

Where:

P(LA) = Launch Availability (overall probability of achieving a launch)

P(SA) = System Availability (probability of hardware being acceptable for launch)

P(LP) = Launch Probability (probability that the vehicle limits are not violated by upper level winds or other natural environment phenomena)

P(LW) = Launch Weather (probability that other launch site weather constraints are not violated)

P(AW) = Abort Weather (probability that abort weather constraints are not violated)

Launch Azimuth The angle formed by the projection of the flight path of the launch vehicle onto the surface of the earth's ellipsoid and the North direction, measured clockwise in degrees.

Launch Opportunity The period of time during which the relative position of the launch site and orbital plane permit a launch vehicle to perform the ascent function.

Life Support A subset of crewed vehicle (or habitat) habitation functions (i.e., a subsystem) that provides and manages breathable air, contamination control, potable water, fire detection/suppression, cabin pressure/temperature/humidity, environmental monitoring, etc.

Long-Duration (Lunar Mission) Human missions to the lunar surface that require pre-deployed Surface Systems. This capability is a requirement in Exploration Spiral 3, and encompasses surface stays from 42 days (threshold) (**TBR-3**) up to 98 days (objective) (**TBR-70**).

Low Earth Orbit (LEO) An orbit around the Earth with a minimum orbital altitude of 170 km and is a stable orbit that will not decay rapidly because of atmospheric drag.

Lunar Architecture Focused Trade Study Ongoing engineering analysis of lunar architecture and mission design options, in support of Exploration architecture decision-making. Results of this study are captured in document ESMD-RQ-0005, "Lunar Architecture Focused Trade Study Final Results".

Lunar Ascent Orbit Used in Exploration Spirals 2 and 3 to define the orbit that the LSAM must achieve when launching from the lunar surface. Defined by the following parameters: Altitude: 100 km +/- (**TBD-8**) km; Inclination angle (wedge angle) with respect to Lunar Reference Orbit: Maximum of 10 degrees (**TBR-71**).

Lunar Day The period of time it takes for the Moon to make one complete orbit around the Earth, due to tidal locking. It is marked from a New Moon to the next New Moon. A lunar day is officially 29 days, 12 hours, 44 minutes and 3 seconds long.

Lunar Reference Orbit Used in Exploration Spirals 2 and 3 to define the lunar orbit for rendezvous and docking of Exploration elements. Defined by the following parameters: Altitude: 100 km +/- (**TBD-8**) km; Inclination: Optimized for the mission.

Lunar Surface Access Module (LSAM) Provides crew transport to the lunar surface from the Lunar Reference Orbit and return from the surface to the Lunar Ascent Orbit; also provides limited surface habitation and EVA capabilities.

Mating The act of mechanically connecting together two major elements of a system. Mating can be performed in space, through docking or berthing, or on the ground through docking, berthing, or other interfaces.

Mission Refers to the sequence of events that must take place to accomplish prescribed scientific, technological, or engineering objective(s). Includes transportation of a flight system (robotic or humancrewed) to a destination, and operational activities at the destination (e.g., the Martian surface).

Mission Capable Refers to the status of an Exploration flight element or mated elements, which have sufficient consumables to fully execute its intended mission from its current location in space.

Mission Opportunity Refers to the Earth departure window to conduct a mission to another planetary destination such as the Moon or Mars. Typically constrained by orbital mechanics and the design of the Exploration System. If assembly of elements in Earth orbit is required, then "Mission Opportunity" refers to the departure window from Earth orbit based on the capability of the Exploration System.

Mission Phase Definitions Used as the basis for functional flow and decomposition of reference Spiral 3 human exploration mission. The Mission Phases identified were Ground Operations, Earth to

Exploration Systems Mission Directorate

Orbit, Earth Orbit Operations, Earth Orbit to Destination Vicinity, Destination Vicinity Operations (A), Destination Vicinity to Surface, Surface Operations, Destination Surface to Destination Vicinity, Destination Vicinity Operations (B), Destination Vicinity to Earth, Earth Reentry, and Recovery (see associated definitions).

Net Habitable Volume The functional pressurized volume left available to the crew after accounting for the loss of volume due to deployed equipment, stowage, trash, and any other items which decrease functional volume. The gravity environment corresponding to the habitable volume must be specified.

Objective Used in requirements language to define the desired capability above the threshold that should be evaluated for feasibility and affordability. Capabilities above the objective are not expected to be pursued or analyzed.

Payload The onboard scientific and exploration utilization (i.e. ISRU) equipment carried by a given spacecraft, generally quantified in terms of mass and volume. Also expressed as the entire mass delivered by a launch vehicle, to orbit.

Polar Regions of the Moon Defined as the area between 80-90 degrees (**TBR-74**) lunar latitude (threshold), with an objective of 70-90 degrees (**TBR-76**).

Probabilistic Risk Assessment A comprehensive, structured, and logical analysis methodology employed to identify and assess risks in technologically complex systems. Probabilistic Risk Assessment results can be used to develop or validate Fault Trees and Failure Modes analysis. They also can be used as a tool for making design and logistics decisions.

Proteomics Analyzing structure, function, and interactions of the proteins produced by the genes of a particular cell, tissue or organism, with applications of the data to medicine or biology.

Proximity Operations Phase of flight operations (near the end of rendezvous and prior to docking; or after undocking) during which two space vehicles are at close ranges (< 1 km) and low relative velocity.

Recovery Phase Begins with completion of Earth surface landing and includes recovery forces operations, vehicle safing, vehicle configuration for recovery, crew egress, crew return to post-mission facilities. Ends with vehicle recovery to post-mission facilities for refurbishment or disposal.

Regolith Fine-grained powdery layer on the lunar surface above the bedrock.

Remotely Commanded Operations The capability to operate a vehicle, system, or subsystem from an external location (e.g., mission control). Remotely commanded operations do not require the presence of an onboard crew.

Rescue The process of locating the crew, proceeding to their position, and transporting them to an appropriate location.

Robotic Precursor Mission A robotic spacecraft mission that supports The Vision by achieving scientific objectives and/or through preparing for future human exploration activities.

Exploration Systems Mission Directorate		
Exploration Crew Transportation System Requirements Document (Spiral 1)	ESMD-RQ-0011	Preliminary (Rev. E)
	Effective Date: 24 Mar 2005	Page 39 of 45

Robotic Precursor Phase Exploration missions accomplished by robotic systems, to prepare for and support future human exploration missions.

Robotic Precursor System Robotic spacecraft that are developed to execute missions that prepare for and support future human exploration, and to accomplish science objectives.

Safety-Critical Software Software is safety-critical if it meets at least one of the following criteria:

1. Resides in a safety-critical system (as determined by a hazard analysis AND at least one of the following:
 - a. Causes or contributes to a hazard.
 - b. Provides control or mitigation for hazards.
 - c. Controls safety-critical functions.
 - d. Processes safety-critical commands or data.
 - e. Detects and reports, or takes corrective action, if system reaches hazardous state.
 - f. Mitigates damage if a hazard occurs.
 - g. Resides on the same system (processor) as safety-critical software.
2. Processes data or analyzes trends that lead directly to safety decisions (e.g., determining when to turn power off to a wind tunnel to prevent system destruction.)
3. Provides full or partial verification or validation of safety-critical systems, including hardware or software subsystems.

Segment Used in the CTS requirements development process to express the identity of two or more elements mated together and operating jointly in a given set of mission phases. Segments defined this way facilitate functional decomposition of capabilities throughout the reference Exploration Spiral 3 mission. For example, the In-Space Transportation Segment is comprised of the CEV and an Earth Departure Stage, and comprises the CTS from the Earth Orbit Operations Mission Phase until CEV-EDS separation during the Destination Vicinity Operations Mission Phase. Other segments were defined as the CEV Launch Segment (CEV and CLV operating through separation in Earth orbit), the Destination Transportation Segment (CEV and LSAM operating in the lunar vicinity), and the Earth Return Segment (CEV only, upon separation from LSAM Ascent Stage).

Spiral Development Process A phased system of systems development process that allows increasing capabilities to be achieved in support of long range objectives. While work can be accomplished concurrently against the objectives associated with multiple spirals, the completion of all objectives for a given spiral is considered necessary to enable achievement of the succeeding spiral. See associated definitions for Exploration Spirals.

Strategy to Task to Technology Process (STTP) Use of engineering analysis to validate architectural and mission design approaches, and identify technology investment needs.

Surface Operations Phase Starts at the completion of landing on the destination surface, including propulsion system shutdown and safing. Representative mission activities include: science operations, system and operational testing, surface EVA, assembly and maintenance, vehicle checkout, and preparation for ascent. Phase ends at initiation of ascent from the destination surface (i.e., T0).

System A set or arrangement of interdependent elements/segments that are used to accomplish mission objective(s). Exploration systems are Crew Transportation, Cargo Delivery, In-Space Support,

Exploration Systems Mission Directorate

	Effective Date: 24 Mar 2005	Page 40 of 45

Destination Surface, Robotic Precursor, and Ground Support. These systems comprise the Exploration System of Systems.

System of Systems A set or arrangement of interdependent systems that are related or connected to provide a given capability. The loss of any portion of the System of Systems will degrade the performance or capabilities of the whole. The systems contained in the Exploration System of Systems (ESS) are: the Crew Transportation System, Cargo Delivery System, In-Space Support System, Destination Surface System, Robotic Precursor System, and Ground Support System. Requirements, constraints, and guidelines that apply to all human and robotic exploration systems are levied against the Exploration System of Systems, and may apply against any or all Exploration Spirals, as specified. The term “System of Systems” is sometimes expressed synonymously as “Super-system”.

Threshold Used in requirements language to define the minimum capability necessary to satisfy the requirement.

Transfer Volume The passageway between two connected element that can contain crew.

Wedge Angle The angle existing between two orbital planes. A plane change maneuver must be accomplished (i.e., through the use of delta-V capability) to negotiate the wedge angle between a given initial orbit plane (e.g., the Earth Reference Orbit) and a desired target orbital plane (e.g., the Lunar Reference Orbit).

5.3 Requirements Taxonomy

The following table is provided as a key to understanding the taxonomy used for requirement Unique ID numbers (i.e., the Unique ID number is shown at the beginning of each requirement statement).

System/Segment	Req. Number	Spiral
ESS (Exploration System of Systems Technical)	0001 - 9999	A = Spiral 1
EPR (Exploration Programmatic Requirements)		B = Spiral 2
EPG (Exploration Programmatic Guidelines)		C = Spiral 3
CTS (Crew Transportation System)		D = Spiral 4
CVS (CEV Launch Segment)		E = Spiral 5
CEV (Crew Exploration Vehicle)		F = Spirals 1 & 2
CVL (CEV Launch Vehicle)		G = Spirals 2 & 3
		H = Spirals 1,2,3
